Finite Automata

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Finite Automata: Example, Graphical Representation The GFA

 $M = (\{s, q, f\}, \{a, b\}, \{sa \rightarrow q, qa \rightarrow q, qb \rightarrow f, fb \rightarrow b\}, s, f)$

can be represented as:

The language accepted by this automaton is

$$L(M) = \{a^n b^m \mid n, m \ge 1\}.$$

・ロト ・ 理 ト ・ ヨ ト ・ ヨ ト ・ ヨ

A generalized finite automaton (GFA) is a 5-tuple $M = (Q, \Sigma, R, s, f)$, where

- Q a finite set of states,
- Σ a finite, nonempty input alphabet,
- ► $R \subseteq Q \times \Sigma^* \times Q$ a finite set of *rules*:

• $(p, w, q) \in R$ written as $pw \rightarrow q$,

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- \blacktriangleright $s \in Q$ the *initial state*,
- $f \in Q$ the final state.

A generalized finite automaton (GFA) is a 5-tuple $M = (Q, \Sigma, R, s, f)$, where

- Q a finite set of states,
- Σ a finite, nonempty input alphabet,
- $R \subseteq Q \times \Sigma^* \times Q$ a finite set of *rules*:

• $(p, w, q) \in R$ written as $pw \rightarrow q$,

- \blacktriangleright $s \in Q$ the *initial state*,
- $f \in Q$ the final state.

Note these peculiarities:

The model is non-deterministic;

Bridges and Islands

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Connected graph

Connected graph: Any two nodes are connected by an undirected path.

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

Disconnected graph

Connected graph: Any two nodes are connected by an undirected path.

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

Bridge

Bridge: an edge such that when it is removed, the graph is no longer connected.

Island

A *bridgeless island* = a maximal bridgeless connected component

Every node and edge is either a bridge or contained in exactly one bridgeless island.

Islands in Automata

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Islands in Automata: The Structure

▶ A state is *useful* if it occurs on some path from *s* to *f*;

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Otherwise, it is useless;

Islands in Automata: The Structure

- A state is useful if it occurs on some path from s to f;
- Otherwise, it is useless;
- Assuming no useless states, the islands will always be aranged linearly:

$$I_1 \longrightarrow I_2 \longrightarrow \cdots \longrightarrow I_n$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Islands in Automata: The Structure

- A state is useful if it occurs on some path from s to f;
- Otherwise, it is useless;
- Assuming no useless states, the islands will always be aranged linearly:

$$I_1 \longrightarrow I_2 \longrightarrow \cdots \longrightarrow I_n$$

- Sketch of Proof:
 - Think of an "island graph" the nodes are islands, the edges are bridges;

- 2. This graph is necessarily a tree;
- 3. There must be exactly one path between I_s and I_f ;
- 4. All states are useful, so all islands must lie on this path.

Islands in Automata: Number Variability

For any integers m, n, a GFA with m bridges can be converted into an equivalent GFA with n bridges;

Islands in Automata: Number Variability

- For any integers m, n, a GFA with m bridges can be converted into an equivalent GFA with n bridges;
- Idea of proof:
 - Redundant states and transitions can merge existing islands and create new ones.

$$s_i \to \langle A_{i1}, i, 1 \rangle, \ \langle i, j - 1 \rangle \to \langle A_{ij}, i, j \rangle \text{ for } \\ p_j : S \to A_{1j} \cdots A_{nj} \in P;$$

Rules to simulate grammar rules of the form A → xB and A → x, A, B ∈ N, x ∈ Σ*, along with ε-rules ensuring that each rule is simulated in exactly m + 1 steps,

$$\begin{array}{l} \blacktriangleright \quad \langle A, i, j \rangle x \rightarrow \langle i, j, 1, B \rangle \text{ for } A \rightarrow xB \in P, \\ \flat \quad \langle i, j, k, B \rangle \rightarrow \langle i, j, k + 1, B \rangle, \ \langle i, j, m, B \rangle \rightarrow \langle B, i, j \rangle, \\ \langle i, j, m, \varepsilon \rangle \rightarrow f_i; \end{array}$$

Bridge rules:

$$\blacktriangleright f_i \to s_{i+1}.$$
Corollary: $PRL_n = \mathcal{L}_e(GFA_n)$

- ▶ $\mathsf{PRL}_n = \mathcal{L}_e(\mathsf{GFA}_n)$
- Proof: See previous slides

- ▶ $\mathsf{PRL}_2 \subset \mathsf{CF};$
- ▶ $\mathsf{PRL}_n \not\subseteq \mathsf{CF}, \mathsf{CF} \not\subseteq \mathsf{PRL}_n, n \ge 3;$
- Finally, $PRL_n = \mathcal{L}_e(GFA_n)$ for all $n \ge 1$.

Accepting Power: Summary

- $\mathcal{L}_e(\text{GFA}_n)$ equivalent to languages generated by *n*-PRLGs:
 - An infinite hierarchy between REG and CS;
 - For $n \ge 3$ incomparable with CF.
- For compactness, El_n will denote L_e(GFA_n) in the following diagram:
