#### Abstract

The present paper introduces and discusses bidirectional contextual grammars as a straightforward generalization of externally generating contextual grammars without choice. In essence, besides ordinary derivation steps, the bidirectional contextual grammars can also make reduction steps, which shorten the rewritten strings. This paper demonstrates that these grammars characterize the family of recursively enumerable languages. In fact, this characterization holds even in terms of one-turn bidirectional contextual grammars, which can change derivations steps to reduction steps during the generation process no more than once.

Keywords contextual grammars, bidirectional grammars, generative power, recursively enumerable languages

## 1 Introduction

Over its history, the language theory has always paid a special attention to the Marcus contextual grammars because these grammars fulfill a significant role in the generation of both natural and formal languages (see [8, 9], chapter 5 and 6 in Volume II of [18]). It thus come as no surprise that the language theory has discussed a large variety of these grammars (see $[6,13,14,16,15]$ ). This paper contributes to this trend by investigating another variant of these grammars whose introduction is inspired by two grammatically oriented studies in the formal language theory. First, more than three decades ago, this theory used grammars with special end markers during the generation of languages (see page 99 in [19]). Second, about two decades ago, the language theory introduced various bidirectional grammars that both derive and reduce strings during their generation process (see $[1,2,3,4,5,12]$ ). These two studies have given rise to the variant of contextual grammars discussed in this paper.

More specifically, this paper introduces bidirectional contextual grammars as a straightforward generalization of the externally generating contextual grammars without choice (see page 240 in Volume II of [18]). A bidirectional contextual grammar, $G$, is based on derivation and reduction rules of the form $(x, y)$, where $x$ and $y$ are strings. From a string $z, G$ makes a derivation step by using a derivation rule, $(u, v)$, like in any externally generating contextual grammars that is, it changes $z$ to $u z v$ by using this derivation rule. In addition, however, by using a reduction rule, $(t, w)$, from $t z w, G$ makes a reduction step so it changes $t z w$ to $z$. If $G$ can make a computation from $G$ 's axiom, $s$, to $\$ z \$$, where $\$$ is a special bounding symbol, $z$ is in the language defined by $G$. Two consecutive computational steps $G$ makes are called a turn if one is a reduction step and the other represents a derivation step. Let $i$ be a non-negative integer. $G$ is an $i$-turn bidirectional contextual grammar if $G$ makes no more than $i$ turns during every generation of string from its language.

As its main result, this paper proves that the bidirectional one-turn contextual grammars characterize the family of recursively enumerable languages. This result is of some interest because externally generating contextual grammars without choice define only the family of minimal linear languages (see Lemma 2.9 on page 247 in Volume II of [18]). In fact, every recursively enumerable language is defined by a one-turn bidirectional contextual grammar. In the conclusion of this paper, we suggest some open problem areas related to this result.

## 2 Preliminaries

We assume that the reader is familiar with the language theory (see [10, 17, 18, 19]). For an alphabet, $V, \operatorname{card}(V)$ denotes the cardinality of $V . V^{*}$ represents the free monoid generated by $V$ under the operation of concatenation. The unit of $V^{*}$ is denoted by $\varepsilon$. Set $V^{+}=V^{*}-\{\varepsilon\}$. For $w \in V^{*},|w|$ and $\operatorname{alph}(w)$ denote the length of $w$ and the set of symbols occurring in $w$, respectively. For $L \subseteq V^{*}, \operatorname{alph}(L)=\{a: a \in \operatorname{alph}(w), w \in L\}$. For $w \in V^{*}$ and for $a \in V, \operatorname{occur}(w, a)$ denotes the number of occurrences of $a$ in $w$. For $w \in V^{*}$, $\operatorname{prefix}(w)$ and $\operatorname{suffix}(w)$ denote the set of all $w$ 's prefixes and suffixes, respectively. For $\left(w_{1}, \ldots, w_{n}\right) \in V_{1}^{*} \times \ldots \times V_{n}^{*}$, where $V_{1}, \ldots, V_{n}$ are finite alphabets, $\operatorname{concat}\left(\left(w_{1}, \ldots, w_{n}\right)\right)=w_{1} \ldots w_{n}$.

A queue grammar (see [7]) is a sixtuple, $Q=(V, T, W, F, s, P)$, where $V$ and $W$ are alphabets satisfying $s \in V W, T \subseteq V, F \subseteq W, s \in(V-T)(W-F)$, and $P \subseteq(V \times(W-F)) \times\left(V^{*} \times W\right)$ is a finite relation whose elements are called productions. For every $a \in V$, there exists a production $(a, b, x, c) \in P$. If $u, v \in V^{*} W$ such that $u=a r b, v=r x c, a \in V, r, x \in V^{*}, b, c \in W$, and $(a, b, x, c) \in P$, then $u \Rightarrow v[(a, b, x, c)]$ in $G$ or, simply, $u \Rightarrow v$. In the standard manner, extend $\Rightarrow$ to $\Rightarrow^{n}$, where $n \geq 0$; then, based on $\Rightarrow^{n}$, define $\Rightarrow^{+}$and $\Rightarrow^{*}$. The language of $Q, L(Q)$, is defined as $L(Q)=\left\{w \in T^{*}: s \Rightarrow^{*}\right.$ $w f$ where $f \in F\}$.

A left-extended queue grammar is a sixtuple, $Q=(V, T, W, F, s, P)$, where
$V, T, W, F, s$, and $P$ have the same meaning as in a queue grammar; in addition, assume that $\# \notin V \cup W$. If $u, v \in V^{*}\{\#\} V^{*} W$ so that $u=w \# a r b$, $v=w a \# r x c, a \in V, r, x, w \in V^{*}, b, c \in W$, and $(a, b, x, c) \in P$, then $u \Rightarrow$ $v[(a, b, x, c)]$ in $G$ or, simply, $u \Rightarrow v$. In the standard manner, extend $\Rightarrow \mathrm{to} \Rightarrow^{n}$, where $n \geq 0$; then, based on $\Rightarrow^{n}$, define $\Rightarrow^{+}$and $\Rightarrow^{*}$. The language of $Q, L(Q)$, is defined as $L(Q)=\left\{v \in T^{*}: \# s \Rightarrow^{*} w \# v f\right.$ for some $w \in V^{*}$ and $\left.f \in V^{*}\right\}$.

## 3 Definitions

A bidirectional contextual grammar is a triple $G=\left(T \cup\{\$\}, P_{d} \cup P_{r}, S\right)$, where $T$ is an alphabet, $\$$ a special symbol, $\$ \notin T, P \subseteq(T \cup\{\$\})^{*} \times(T \cup\{\$\})^{*}$, $P=P_{d} \cup P_{r}$, and $S$ is a finite language over $T$. For every $x \in(T \cup\{\$\})^{*}$ and $(u, v) \in P_{d}$, write $x_{d} \Rightarrow u x v$, and for every $(u, v) \in P_{r}$, write uxv ${ }_{r} \Rightarrow$ $x$; intuitively, $d$ and $r$ stand for a direct derivation and a direct reduction, respectively. To express that $G$ makes $x_{d} \Rightarrow u x v$ according to ( $u, v$ ), write $x_{d} \Rightarrow u x v[(u, v)] ; u x v_{r} \Rightarrow x[(u, v)]$ has an analogical meaning in terms of $r \Rightarrow$. Let $y, x \in(T \cup\{\$\})^{*}$. We say that $G$ makes a direct computation of $x$ from $y$, symbolically written as $y \Rightarrow x$, if either $y_{d} \Rightarrow x$ or $y_{r} \Rightarrow x$ in $G$. In the standard manner, extend $\Rightarrow$ to $\Rightarrow^{m}$, where $m \geq 0$; then, based on $\Rightarrow^{m}$, define $\Rightarrow^{+}$and $\Rightarrow^{*}$. The $\$$-bounded language generated by $G,{ }_{\$} L(G)$, is defined as

$$
{ }_{\$} L(G)=\left\{z: s \Rightarrow^{*} \$ z \$ \text { in } G, z \in T^{*}, s \in S\right\} .
$$

A computation of the form $s \Rightarrow^{*} \$ z \$$ in $G$, where $z \in T^{*}$ and $s \in S$, is said to be successful. Any two-step computation, $y \Rightarrow^{2} x$, where $y, x \in(T \cup\{\$\})^{*}$, represents a turn if $y \Rightarrow^{2} x$ is of the form $y_{d} \Rightarrow z_{r} \Rightarrow x$ or $y_{r} \Rightarrow z_{d} \Rightarrow x$, for some $z \in(T \cup\{\$\})^{*}$; less formally, the two-step computation $y \Rightarrow^{2} x$ consists of one direct derivation and one direct reduction. $G$ is $i$-turn if any successful computation in $G$ contains no more than $i$ turns.

## 4 Results

This section demonstrates that every recursively enumerable language is defined by a one-turn bidirectional contextual grammar.

Lemma 1. For every recursively enumerable language, $L$, there is a leftextended queue grammar, $G$, such that $L=L(G)$.

Proof. See Lemma 1 in [7].
Lemma 2. Let $Q^{\prime}$ be a left-extended queue grammar. Then, there exists a left-extended queue grammar, $Q=(V, T, W, F, s, R)$, such that $L\left(Q^{\prime}\right)=L(Q)$, $W=X \cup Y \cup\{1\}$, where $X, Y,\{1\}$ are pairwise disjoint, and every $(a, b, x, c) \in R$ satisfies either $a \in V-T, b \in X, x \in(V-T)^{*}, c \in X \cup\{1\}$ or $a \in V-T$, $b \in Y \cup\{1\}, x \in T^{*}, c \in Y$.

Proof. See Lemma 1 in [11].

Consider the left-extended queue grammar, $Q=(V, T, W, F, s, R)$, from Lemma 2. Its properties imply that $Q$ generates every word in $L(Q)$ so that it passes through state 1. Before it enters 1, it generates only words over $V-T$; after entering 1 , it generates only words over $T$. In greater detail, the next corollary expresses this property, which fulfills a crucial role in the proof of Theorem 1.

Corollary 1. $Q$ constructed in the proof of Lemma 2 generates every $h \in L(Q)$ in this way

$$
\begin{array}{lll} 
& \# a_{0} q_{0} & \\
\Rightarrow & a_{0} \# x_{0} q_{1} & {\left[\left(a_{0}, q_{0}, z_{0}, q_{1}\right)\right]} \\
\Rightarrow & a_{0} a_{1} \# x_{1} q_{2} & {\left[\left(a_{1}, q_{1}, z_{1}, q_{2}\right)\right]} \\
& \vdots & \\
\Rightarrow & a_{0} a_{1} \ldots a_{k} \# x_{k} q_{k+1} & {\left[\left(a_{k}, q_{k}, z_{k}, q_{k+1}\right)\right]} \\
\Rightarrow & a_{0} a_{1} \ldots a_{k} a_{k+1} \# x_{k+1} y_{1} q_{k+2} & {\left[\left(a_{k+1}, q_{k+1}, y_{1}, q_{k+2}\right)\right]} \\
& \vdots & \\
\Rightarrow & a_{0} a_{1} \ldots a_{k+m-1} \# x_{k+m-1} y_{1} \ldots y_{m-1} q_{k+m} & {\left[\left(a_{k+m-1}, q_{k+m-1}, y_{m-1}, q_{k+m}\right)\right]} \\
\Rightarrow & a_{0} a_{1} \ldots a_{k+m-1} a_{k+m} \# y_{1} \ldots y_{m} q_{k+m+1} & {\left[\left(a_{k+m}, q_{k+m}, y_{m}, q_{k+m+1}\right)\right],}
\end{array}
$$

where $k, m \geq 1, a_{i} \in V-T$ for $i=0, \ldots, k+m, x_{j} \in(V-T)^{*}$ for $j=$ $1, \ldots, k+m, s=a_{0} q_{0}, a_{j} x_{j}=x_{j-1} z_{j}$ for $j=1, \ldots, k, a_{1} \ldots a_{k} x_{k}=z_{0} \ldots z_{k}$, $a_{k+1} \ldots a_{k+m}=x_{k}, q_{0}, q_{1}, \ldots, q_{k+m} \in W-F$ and $q_{k+m+1} \in F, z_{0}, \ldots, z_{k} \in$ $(V-T)^{*}, y_{1}, \ldots, y_{m} \in T^{*}, h=y_{1} y_{2} \ldots y_{m-1} y_{m}$.

Theorem 1. Let $L$ be a recursively enumerable language. Then, there exists a one-turn bidirectional contextual grammar, $G$, such that $L={ }_{\$} L(G)$.

Proof. Let $L$ be a recursively enumerable language. Let $Q=(V, T, W, F, s, R)$ be a left-extended queue grammar such that $L(Q)=L$ and $Q$ satisfies the properties described in Lemma 2 and Corollary 1. Select a symbol, $o \in T$. Define the injection, $\alpha$, from $R$ to $\{o\}^{+}$so that $\alpha$ is an injective homomorphism when its domain is extended to $R^{*}$. Further, define the binary relation, $f$, over $V$ so that $f(\varepsilon)=\varepsilon$ and $f(a)=\left\{\alpha\left(\left(a, b, c_{1} \ldots c_{n}, d\right)\right):\left(a, b, c_{1} \ldots c_{n}, d\right) \in R\right\}$ for all $a \in V$. Similarly, define the binary relation, $g$, over $W$ so that $g(b)=$ $\left\{\alpha\left(\left(a, b, c_{1} \ldots c_{n}, d\right)\right):\left(a, b, c_{1} \ldots c_{n}, d\right) \in R\right\}$ for all $b \in W$. In the standard manner, extend the domain of $f$ and $g$ to $V^{*}$ and $W^{*}$, respectively. Define the bidirectional contextual grammar,

$$
G=\left(T \cup\{\$\}, P_{d} \cup P_{r}, S\right),
$$

with
$S=\left\{c_{1} \ldots c_{n} \$ \alpha\left(\left(a, b, c_{1} \ldots c_{n}, d\right)\right):\left(a, b, c_{1} \ldots c_{n}, d\right) \in R, c_{1}, \ldots, c_{n} \in T\right.$ for some $\left.n \geq 0, d \in F\right\}$
and $P_{d}, P_{r}$ constructed as follows:

1. For every $\left(a, b, c_{1} \ldots c_{n}, d\right) \in R, c_{1}, \ldots, c_{n} \in T$, for some $n \geq 0, d \in$ $(W-F), \bar{d} \in g(d)$, add
$\left(c_{1} \ldots c_{n}, \$ \$ \bar{d} \$ \$ \alpha\left(\left(a, b, c_{1} \ldots c_{n}, d\right)\right)\right)$ to $P_{d}$;
2. For every $\left(a, b, c_{1} \ldots c_{n}, d\right) \in R, c_{1}, \ldots, c_{n} \in(V-T)$, for some $n \geq 0$, $d \in(W-F), \bar{c}_{1} \in f\left(c_{1}\right), \ldots, \bar{c}_{n} \in f\left(c_{n}\right), \bar{d} \in g(d)$, add $\left(\bar{c}_{1} \$ \bar{c}_{2} \$ \ldots \bar{c}_{n} \$, \$ \$ \bar{d} \$ \$ \alpha\left(\left(a, b, c_{1} \ldots c_{n}, d\right)\right)\right)$ to $P_{d} ;$
3. For every $\bar{a}_{0} \in f\left(a_{0}\right), \bar{q}_{0} \in f\left(q_{0}\right)$ such that $s=a_{0} q_{0}$, add $\left(\$ \bar{a}_{0} \$, \$ \$ \bar{q}_{0} \$ \$\right)$ to $P_{d}$;
4. For every $r \in R$, add

$$
(\$ \alpha(r), \alpha(r) \$ \$ \alpha(r) \$ \$) \text { to } P_{r}
$$

Denote the set of productions introduced in step $i$ of the construction by ${ }_{i} P_{d}$, for $1 \leq i \leq 3$.

## Basic Idea:

Each simulation consists of two phases. In the first phase, the simulation of $Q$ 's derivation is performed nondeterministically, and in the second phase, this simulation is verified. Next, we sketch both phases in greater detail.

Simulation phase $G$ performs the simulation of $Q$ in reverse. That is, the last derivation step in $Q$ is simulated first in $G$, and the first step in $Q$ is simulated last in $G$. In general, $G$ keeps the binary code of the string over $V$ that $Q$ generates as a prefix of the current sentential form while keeping the binary code of states as its suffix. By a string from $S$, the $Q$ 's production of the form $p_{0}$ : $\left(a, b, c_{1} \ldots c_{n}, d\right), d \in F$ is simulated; it places $c_{1} \ldots c_{n}$ as the prefix and the $p_{0}$ 's code as the suffix of the sentential form. Then, productions $p_{1}:\left(a, b, c_{1} \ldots c_{n}, d\right)$, $c_{1}, \ldots, c_{n} \in T, d \in(W-F)$ are simulated by productions from ${ }_{1} P_{d}$. They place $c_{1} \ldots c_{n}$ as the prefix and the codes of $d$ and $p_{1}$ as the suffix of the sentential form. The suffix codes of the sentential form are always separated by $\$ \$$. Productions from ${ }_{2} P_{d}$ simulate productions $p_{2}:\left(a, b, c_{1} \ldots c_{n}, d\right), c_{1}, \ldots, c_{n} \in(V-T)$; they place codes of $c_{1}, \ldots, c_{n}$ as the prefix and, again, $d$ 's and $p_{2}$ 's code as the suffix. The prefix codes are always separated by $\$$. Finally, by productions from ${ }_{3} P_{d}$, the axiom $s=a_{0} q_{0}$ from $Q$ is simulated.

Verification phase During every step of the verification phase, $G$ makes sure that the two suffix binary codes and the prefix binary code correspond to the same production in $Q$. If they do, all these three codes are removed from the sentential form. In this way, step by step, $G$ verifies that the previously made simulation phase was performed properly.

## Rigorous proof (Sketch):

Claim 1. $G$ generates every $w \in{ }_{\$} L(G)$ in the following way:

$$
\begin{array}{llll}
s & \Rightarrow^{+} & v & {[\rho]}  \tag{1}\\
& \Rightarrow^{+} & w & {[\tau],}
\end{array}
$$

where $s \in S, v \in\{\$\} p_{n}\{\$\} p_{n-1} \ldots\{\$\} p_{1}\{\$\} w\{\$\} p_{1}\{\$\}\{\$\} p_{1}\{\$\}\{\$\} \ldots p_{n-1}\{\$\}\{\$\} p_{n-1}$ $\{\$\}\{\$\} p_{n}\{\$\}\{\$\} p_{n}\{\$\}\{\$\}, n \geq 1$, where $\alpha^{-1}\left(p_{1}\right) \in R, \ldots, \alpha^{-1}\left(p_{n}\right) \in R$ and $w \in T^{*}$. Sequences $\rho$ and $\tau$ denote productions from ${ }_{1} P_{d} \cup{ }_{2} P_{d} \cup{ }_{3} P_{d} \cup P_{r}$ and $P_{r}$, respectively.

Proof. Observe that every $p_{d} \in{ }_{1} P_{d} \cup_{2} P_{d} \cup_{3} P_{d}$ satisfies occur $\left(\operatorname{concat}\left(p_{d}\right), \$\right) \geq 4$. By the definition of ${ }_{\$} L(G)$, however, precisely two $\$$ s occur in the generated sentence. Therefore, no production from ${ }_{1} P_{d} \cup{ }_{2} P_{d} \cup{ }_{3} P_{d}$ is applied in the very last computation step. For the same reason, $s \notin{ }_{\$} L(G)$, for any $s \in S$, because $\operatorname{occur}(s, \$)=1$ for every $s \in S$. Therefore,

$$
\begin{array}{llll}
s & \Rightarrow^{+} & v & {[\rho]} \\
& \Rightarrow^{+} & w & {[\tau] .}
\end{array}
$$

Observe that an application of every production from $P_{d}$ removes three identical codes $\alpha(r), r \in R$. More specifically, one prefix code and two subsequent suffix codes of the sentential form are removed. Furthermore, notice that the prefix codes and the suffix codes of the sentential form have to be separated by $\$$ and $\$ \$$, respectively. Next, we consider the following four forms of $v$ and demonstrate that $G$ can generate a member of ${ }_{\S} L(G)$ from none of them.

1. Let $v \in\{\$\} p_{n-1} \ldots\{\$\} p_{1}\{\$\} w\{\$\} p_{1}\{\$\}\{\$\} p_{1}\{\$\}\{\$\} \ldots p_{n-1}\{\$\}\{\$\} p_{n-1}$ $\{\$\}\{\$\} p_{n}\{\$\}\{\$\} p_{n}\{\$\}\{\$\}, n \geq 1$, where $\alpha^{-1}\left(p_{1}\right) \in R, \ldots, \alpha^{-1}\left(p_{n}\right) \in R$ (notice that $\{\$\} p_{n} \notin \operatorname{prefix}(v)$ ). In the case that $p_{i-1}=p_{i}$ for all $1 \leq i \leq n$ and $w=p_{1}$, the reduction phase can be preformed. After all applicable reducing productions are used, the resulting sentence consists only from $\$$, which is not in $\$ L(G)$.
2. Let $v \in\{\$\} p_{n-2} \ldots\{\$\} p_{1}\{\$\} w\{\$\} p_{1}\{\$\}\{\$\} p_{1}\{\$\}\{\$\} \ldots p_{n-1}\{\$\}\{\$\} p_{n-1}$ $\{\$\}\{\$\} p_{n}\{\$\}\{\$\} p_{n}\{\$\}\{\$\}$ (notice that $\left.\{\$\} p_{n}\{\$\} p_{n-1} \notin \operatorname{prefix}(v)\right)$. In the case that $p_{i-2}=p_{i}$ for all $1 \leq i \leq n, p_{1}=p_{2}$ and $w=p_{3}$, the reduction phase can be preformed. The resulting sentence satisfies $\{\$\}\{\$\} p_{1}\{\$\}\{\$\}$, which is not in ${ }_{\$} L(G)$ either.
3. Let $v \in\{\$\} p_{n}\{\$\} p_{n-1} \ldots\{\$\} p_{1}\{\$\} w\{\$\} p_{1}\{\$\}\{\$\} p_{1}\{\$\}\{\$\} \ldots p_{n-1}\{\$\}\{\$\} p_{n-1}$ $\{\$\}\{\$\}$ (notice that $p_{n}\{\$\}\{\$\} p_{n}\{\$\}\{\$\} \notin \operatorname{suffix}(v)$ ). In the case that $p_{i-1}=p_{i}$ for all $1 \leq i \leq n$, the reduction phase can be preformed. In this case, however, the reduction ends when the sentential form satisfies $\{\$\} p_{1}\{\$\} w\{\$\}$, so the computation ends unsuccessfully as well.
4. All other cases, where the number of prefix codes and suffix codes of $v$ does not match, lead to an unsuccessful computation.

Hence, to generate a string $w \in{ }_{\$} L(G)$, the sentential form $v$ has to have the form $v \in\{\$\} p_{n}\{\$\} p_{n-1} \ldots\{\$\} p_{1}\{\$\} w\{\$\} p_{1}\{\$\}\{\$\} p_{1}\{\$\}\{\$\} \ldots p_{n-1}\{\$\}\{\$\} p_{n-1}$ $\{\$\}\{\$\} p_{n}\{\$\}\{\$\} p_{n}\{\$\}\{\$\}$. Therefore, this claim holds.

Claim 2. Every $s \Rightarrow^{+} v$ from (1) described in Claim 1 can be expressed in greater detail as

$$
\begin{array}{llll}
s & d_{d} \Rightarrow^{*} & u & {[\xi]} \\
& d \Rightarrow & v & {\left[p_{n}\right],}
\end{array}
$$

where $u \in p_{n-1}\{\$\} p_{n-2} \ldots\{\$\} p_{1}\{\$\} w\{\$\} p_{1}\{\$\}\{\$\} p_{1}\{\$\}\{\$\} \ldots p_{n-1}\{\$\}\{\$\} p_{n-1}\{\$\}\{\$\} p_{n}$, $n \geq 1$ with $\alpha^{-1}\left(p_{1}\right) \in R, \ldots, \alpha^{-1}\left(p_{n}\right) \in R$. Production $p_{n} \in{ }_{3} P_{d}$ has the form $\left(\$ \alpha\left(r_{n}\right) \$, \$ \$ \alpha\left(r_{n}\right) \$ \$\right), r_{n} \in R, \xi$ represents a sequence of productions from ${ }_{1} P_{d} \cup{ }_{2} P_{d}$.

Proof. First, observe that every $s \in S$ satisfies $\$ \notin \operatorname{suffix}(s)$, and every production $p_{d} \in{ }_{1} P_{d} \cup{ }_{2} P_{d}$ satisfies $\$ \notin \operatorname{suffix}\left(\operatorname{concat}\left(p_{d}\right)\right)$. As every $p_{r} \in P_{r}$ satisfies $\$ \$ \in \operatorname{suffix}\left(\operatorname{concat}\left(p_{r}\right)\right), p_{r}$ cannot be used after an application of production from ${ }_{1} P_{d} \cup{ }_{2} P_{d}$. As $\$ \$ \in \operatorname{suffix}\left(\operatorname{concat}\left(p_{3}\right)\right)$ and $\$ \in \operatorname{prefix}\left(\operatorname{concat}\left(p_{3}\right)\right)$ for all $p_{3} \in{ }_{3} P_{d}$, after an application of $p_{3}$ productions from $P_{r}$ can be used. Therefore, the computation can be expressed as

$$
\begin{array}{llll}
s & d^{\prime} \Rightarrow^{*} & u_{1} & {\left[\xi_{1}\right]} \\
& d \Rightarrow & u_{2} & {\left[p_{3}\right]} \\
& \Rightarrow{ }^{*} & v & {\left[\xi_{2}\right],}
\end{array}
$$

where $\xi_{1}$ and $\xi_{2}$ are sequences of productions from ${ }_{1} P_{d} \cup{ }_{2} P_{d}$ and ${ }_{1} P_{d} \cup{ }_{2} P_{d} \cup$ ${ }_{3} P_{d} \cup P_{r}$, respectively. Next, we show that $u_{2} \Rightarrow^{0} v$ and $\xi_{1}=\xi$.

Now, we demonstrate that after any application of a production from $P_{r}$, the sentential form $w$ satisfies $\$ \in \operatorname{suffix}(w)$. In what follows, $\alpha^{-1}\left(p_{0}\right) \in$ $R, \ldots, \alpha^{-1}\left(p_{n}\right) \in R, \alpha^{-1}\left(p_{1}^{\prime}\right) \in R, \ldots, \alpha^{-1}\left(p_{n+1}^{\prime}\right) \in R$ for some $n \geq 0$. The generation starts from $s \in S$, which is of the form $T^{*}\{\$\} p_{0}$. Productions from ${ }_{1} P_{d} \cup{ }_{2} P_{d}$ have the form $\left((T \cup\{\$\})^{*},\{\$\}\{\$\} p_{i}^{\prime}\{\$\}\{\$\} p_{i}\right), 1 \leq$ $i \leq n$; after their $n$ applications followed by one application of a production from ${ }_{3} P_{d}$ of the form $\left((T \cup\{\$\})^{*},\{\$\}\{\$\} p_{n+1}^{\prime}\{\$\}\{\$\}\right)$, we obtain $(T \cup\{\$\})^{*} T^{*}\{\$\} p_{0}\{\$\}\{\$\} p_{1}^{\prime}\{\$\}\{\$\} p_{1} \ldots\{\$\}\{\$\} p_{n}^{\prime}\{\$\}\{\$\} p_{n}\{\$\}\{\$\} p_{n+1}^{\prime}\{\$\}\{\$\}$. If $p_{i}=p_{i+1}^{\prime}, 1 \leq i \leq n$ and the prefix of the sentential form satisfies some other requirements, productions from $P_{r}$ can start performing reduction so that they erase $p_{i}\{\$\}\{\$\} p_{i+1}^{\prime}\{\$\}\{\$\}$ from the suffix and some other symbols from the prefix of the sentential form. Finally, when we get by this reduction a sentential form of the form $(T \cup\{\$\})^{*} T^{*}\{\$\}$ no other productions from $P_{r}$ can be used. Observe that after any application of a production from $P_{r}$, the sentential form $w$ satisfies $\$ \in \operatorname{suffix}(w)$.

The sentential form $w$ satisfies $\$ \in \operatorname{suffix}(w)$ after an application of a production from $P_{r}$, and every production $p_{d} \in{ }_{1} P_{d} \cup{ }_{2} P_{d} \cup{ }_{3} P_{d}$ has the form $\left((T \cup\{\$\})^{*},\{\$\}\{\$\}(T \cup\{\$\})^{*}\right)$. Therefore, by the derivation $w_{d} \Rightarrow w_{1}\left[p_{d}\right]$, we get $\$ \$ \$ \in \operatorname{suffix}\left(w_{1}\right)$ so the computation is blocked. For this reason, only productions from $P_{r}$ can be used after the application of production from ${ }_{3} P_{d}$. To
successfully reduce the sentential form, $u$, observe that $u$ has to follow the form described in the formulation of this claim.

Putting together the previous two claims, we see that every successful computation is of the form

$$
\begin{array}{llll}
s & d^{\Rightarrow^{*}} & u & {[\xi]} \\
& d \Rightarrow & v & {\left[p_{3}\right]} \\
& \Rightarrow^{*} & w & {[\eta]}
\end{array}
$$

where $p_{3} \in{ }_{3} P_{d}, \xi$ and $\eta$ are sequences of productions from ${ }_{1} P_{d} \cup{ }_{2} P_{d}$ and $P_{r}$, respectively.

The bidirectional contextual grammar, $G$, simulates the queue grammar, $Q$, in reverse by a string from $S$ and productions ${ }_{1} P_{d} \cup_{2} P_{d} \cup_{3} P_{d}$. Productions from $P_{r}$ perform the verification of this simulation in the same order as $Q$ makes its derivation steps. The succession of states is checked in the suffix of the sentential form, the queue is simulated in the prefix. As we expect $Q$ to satisfy Lemma 2 and Corollary 1 and the succession of states is checked, we can express the computation as a whole in a more detailed way:

$$
\begin{array}{llll}
s & d^{\Rightarrow^{*}} & y & {[\psi]} \\
& d \Rightarrow^{*} & u & {[\zeta]} \\
& d \Rightarrow & v & {\left[p_{3}\right]} \\
r \Rightarrow^{*} & w & {[\eta],}
\end{array}
$$

where $\psi$ and $\zeta$ denote sequences of productions from ${ }_{1} P_{d}$ and ${ }_{2} P_{d}$, respectively. Examine this computation and the productions to see that $w \in{ }_{\$} L(G)$ if and only if $w \in L(Q)$.
