Classification of Parallel Grammars

- **I. Totally parallel grammars**, such as *L* systems, rewrite **all** symbols of the sentential form during a single derivation step (not discussed in this talk).
- **II. Partially parallel grammars** rewrite **some** symbols while leaving the other symbols unrewritten.
 - Scattered Context Grammars work in a partially parallel way.
 - These grammars are central to this talk.

Scattered Context Grammars (SCGs)

Essence

- semi-parallel grammars
- application of several context-free productions during a single derivation step
- stronger than CFGs

Main Topics under Discussion

- reduction of the grammatical size
- new language operations

Concept

- sequences of context-free productions
- several nonterminals are rewritten in parallel while the rest of the sentential form remains unchanged

Definition

Scattered context grammar:

- G = (N, T, P, S)
- N, T, and S as in a CFG
- P is a finite set of productions of the form $(A_1, A_2, ..., A_n) \rightarrow (x_1, x_2, ..., x_n)$ where $A_i \in N$ and $x_i \in V^*$ with $V = N \cup T$

Direct derivation:

• $u_1A_1u_2A_2u_3 \dots u_nA_nu_{n+1} \Rightarrow u_1x_1u_2x_2u_3 \dots u_nx_nu_{n+1}$ if $(A_1, A_2, \dots, A_n) \rightarrow (x_1, x_2, \dots, x_n)$

Generated language:

• $L(G) = \{ w: S \Rightarrow^* w \text{ and } w \in T^* \}$

Productions:

(S)
$$\rightarrow$$
 (AA), (A, A) \rightarrow (aA, bAc), (A, A) \rightarrow (ϵ , ϵ)

Derivation:

$$S \Rightarrow AA \Rightarrow aAbAc \Rightarrow aaAbbAcc \Rightarrow aabbcc$$

Generated Language:

$$L(G) = \{a^ib^ic^i: i \ge 0\}$$

Language Families

Language Families

- CS Context Sensitive Languages
- **RE** Recursively Enumerable Languages
- $SC = \{L(G): G \text{ is a SCG}\}$

for every $n \ge 1$,

• $SC(n) = \{L(G): G \text{ is a SCG with no more than } n \text{ nonterminals}\}$

Reduction of SCGs

Reduction of SCGs

- (A) reduction of the number of nonterminals
- (B) reduction of the number of context (non-context-free) productions
- (C) simultaneous reduction of (A) and (B)

Reduction (A) 1/2

Reduction of the Number of Nonterminals

- Theorem 1: RE = SC(3)
- Theorem 2: $CS \not\subset SC(1)$
- **Proof** (Sketch): Let $L = \{a^h: h = 2^n, n \ge 1\}$. Assume that L = L(G), where $G = (\{S\}, \{a\}, P, S)$ is a SCG. In G, $S \Rightarrow *a^iSa^j \Rightarrow *a^ia^ka^j$

for some $i, j \ge 0$ such that $i + j, k \ge 1$. Thus, $S \Rightarrow *a^{in}Sa^{jn} \Rightarrow *a^{in}a^ka^{jn}$

for every $n \ge 0$. As $a^j a^k a^j \in L$, $|a^j a^k a^j| = i + k + j = 2^m$. Consider $v = a^{2i} a^k a^{2j} \in L$. Then, $2^m < |v| = 2^m + i + j < 2^{m+1}$, so $v \notin L$ —a contradiction.

Reduction (A) 2/2

• Corollary: $SC(1) \subset SC(3) = RE$

• Open Problem: RE = SC(2)?

Reduction of SCGs

- (A) reduction of the number of nonterminals
- (B) reduction of the number of context (non-context-free) productions
- (C) reduction of (A) and (B)

Reduction (B) 1/5

Reduction of the Number of Context Productions

• A *context production* means a non-context-free production $(A_1, A_2, ..., A_n) \rightarrow (x_1, x_2, ..., x_n)$ with $n \ge 2$

 Theorem 4: Every language in *RE* is generated by a scattered context grammar with only these two context productions:

$$(\$, 0, 0, \$) \rightarrow (\epsilon, \$, \$, \epsilon)$$

 $(\$, 1, 1, \$) \rightarrow (\epsilon, \$, \$, \epsilon)$

Reduction (B) 2/5

I. Left-Extended Queue Grammar

$$Q = (V, T, W, F, s, R)$$

R - finite set of productions of the form (a, q, z, r). Every generation of $h \in L(Q)$ has this form

where $h = y_1...y_m$ with $q_{k+m+1} \in F$

Reduction (B) 3/5

II. Substitutions

g: binary code of symbols from V

h: binary code of states from *W*

III. Introduction of SCG

$$G = (N, T, CF \cup Context, S)$$

 $Context = \{ (\$, 0, 0, \$) \rightarrow (\epsilon, \$, \$, \epsilon), (\$, 1, 1, \$) \rightarrow (\epsilon, \$, \$, \epsilon) \}$

IV. CF used to generate

$$g(a_0 a_1 \dots a_k a_{k+1} \dots a_{k+m}) y_1 \dots y_m h(q_{k+m} \dots q_{k+1} q_k \dots q_1 q_0)$$

Reduction (B) 4/5

V. Context used to verify

```
g(a_0 a_1 \dots a_k a_{k+1} \dots a_{k+m}) = h(q_0 q_1 \dots q_k q_{k+1} \dots q_{k+m})
let g(a_0 a_1 \dots a_k a_{k+1} \dots a_{k+m}) = c_0 c_1 \dots c_{(k+m)2n}
let h(q_0q_1...q_kq_{k+1}...q_{k+m}) = d_0d_1...d_{(k+m)2n}
where each c_i, d_i \in \{0, 1\}
By using (\$, 0, 0, \$) \rightarrow (\epsilon, \$, \$, \epsilon) and
(\$, 1, 1, \$) \rightarrow (\varepsilon, \$, \$, \varepsilon), G makes
c_0 c_1 c_2 \dots c_{(k+m)2n} v_1 \dots v_m d_{(k+m)2n} \dots d_2 d_1 d_0
c_1 c_2 \dots c_{(k+m)2n} \gamma_1 \dots \gamma_m d_{(k+m)2n} \dots d_2 d_1
c_2 \dots c_{(k+m)2n} y_1 \dots y_m d_{(k+m)2n} \dots d_2
y_1...y_m$
y_1 \dots y_m
```

Reduction (B) 5/5

- Corollary 5: The SCGs with two context productions characterize RE.
- Open Problem: What is the power of the SCGs with a single context production?

Reduction of SCGs

Reduction of SCGs

- (A) reduction of the number of nonterminals
- (B) reduction of the number of context (non-context-free) productions
- (C) reduction of (A) and (B)

Simultaneous Reduction (A) & (B)

Simultaneous Reduction of the Number of Nonterminals and the Number of Context Productions

- Note: Next two theorems were proved in cooperation with H. Fernau (Germany).
- Theorem: Every type-0 language is generated by a SCG with no more than seven context productions and no more than five nonterminals
- Theorem: Every type-0 language is generated by a SCG with no more than six context productions and no more than six nonterminals
- Open Problem: Can we improve the above theorems?

4

New Operations

ε-free SCGs

- ϵ -free SCG: each production $(A_1, ..., A_n) \to (x_1, ..., x_n)$ satisfies $x_i \neq \epsilon$
- ε -free **SC** = {L(G): G is an ε -free SCG }
- ε-free SC ⊆ CS ⊂ SC = RE
- Objective: Increase of ε -free **SC** to **RE** by a simple language operation over ε -free **SC**

Coincidental Extension 1/6

Coincidental Extension

- For a symbol, #, and a string, $x = a_1 a_2 ... a_{n-1} a_n$, any string of the form $\# a_1 \# a_2 \# ... \# a_{n-1} \# a_n \# a_n \# a_n$, where $i \ge 0$, is a coincidental #-extension of x.
- A language, K, is a coincidental #-extension of L if every string of K represents a coincidental extension of a string in L and the deletion of all #s in K results in L, symbolically written as L # K
- If $L_\# \blacktriangleleft K$ and there are an infinitely many coincidental extensions of x in K for every $x \in L$, we write $L_\# \blacktriangleleft_\infty K$

Coincidental Extension 2/6

Examples:

For
$$X = \{\#'a\#'b\#': i \ge 5\} \cup \{\#'c^n\#'d^n\#': n, i \ge 0\}$$
 and $Y = \{ab\} \cup \{c^nd^n: n \ge 0\},$ $Y_\# \blacktriangleleft_\infty X$, so $Y_\# \blacktriangleleft X$.

For
$$A = \{\#a\#b\#\} \cup \{\#^iC^n\#^iC^n\#^i: n, i \ge 0\}$$
, $Y_\# \blacktriangleleft A$ holds, but $Y_\# \blacktriangleleft_\infty A$ does not hold.

 $B = \{ \#^i a \#^i b \#^i : i \ge 5 \} \cup \{ \#^i c^n \#^i d^n \#^{i+1} : n, i \ge 0 \}$ is not the coincidental #-extension of any language.

Coincidental Extension 3/6

- **Theorem**: Let K ∈ RE. Then, there exists a ε-free SCG, G, such that $K \#_{\infty} L(G)$.
- **Proof** (Sketch): Let K ∈ RE. There exists a SCG, G, such that L = L(G). Construct a ε-free SCG, $G = (V, P, S, \{\#\} \cup T)$, so that $L _{\#} \blacktriangleleft_{\infty} L(G)$.

Homomorphism *h*:

h(A) = A for every nonterminal A

h(a) = a for every terminal a

 $h(\varepsilon) = Y$

Coincidental Extension 4/6

P constructed by performing the next six steps:

- **I.** add $(Z) \rightarrow (YS^{\$})$ to P
- **II.** for every $(A_1, ..., A_n) \rightarrow (x_1, ..., x_n) \in P$, add $(A_1, ..., A_n, \$) \rightarrow (h(x_1), ..., h(x_n), \$)$ to P
- **III.** add $(Y, \$) \rightarrow (YY, \$)$ to P
- **IV.** for every a, b, $c \in T$, add $(\langle a \rangle, \langle b \rangle, \langle c \rangle, \$) \rightarrow (\langle 0a \rangle, \langle 0b \rangle, \langle 0c \rangle, \$)$ to P
- V. for every $a, b, c, d \in T$, add $(Y, \langle 0a \rangle, Y, \langle 0b \rangle, Y, \langle 0c \rangle, \S) \rightarrow (\#, \langle 0a \rangle, X, \langle 0b \rangle, Y, \langle 0c \rangle, \S), (\langle 0a \rangle, \langle 0b \rangle, \langle 0c \rangle, \S) \rightarrow (\langle 4a \rangle, \langle 1b \rangle, \langle 2c \rangle, \S), (\langle 4a \rangle, X, \langle 1b \rangle, Y, \langle 2c \rangle, \S) \rightarrow (\langle 4a \rangle, \#, \langle 1b \rangle, X, \langle 2c \rangle, \S), (\langle 4a \rangle, \langle 1b \rangle, \langle 2c \rangle, \langle d \rangle, \S) \rightarrow (a, \langle 4b \rangle, \langle 1c \rangle, \langle 2d \rangle, \S), (\langle 4a \rangle, \langle 1b \rangle, \langle 2c \rangle, \S) \rightarrow (a, \langle 1b \rangle, \langle 3c \rangle, \S), (\langle 1a \rangle, X, \langle 3b \rangle, Y, \S) \rightarrow (\langle 1a \rangle, \#, \langle 3b \rangle, \#, \S)$ to P

Coincidental Extension 5/6

VI. for every
$$a, b \in T$$
, add $(\langle 1a \rangle, X, \langle 3b \rangle, \S) \rightarrow (a, \#, b, \#)$ to P.

G generates every $y \in L(G)$ in this way

$$Z \Rightarrow YS \Rightarrow + x \Rightarrow v \Rightarrow + z \Rightarrow y$$

where
$$v \in (\mathcal{T}\{Y\}^+)^+\{\$\}$$
. In addition,
$$v = u_0\langle 0a_1\rangle u_1\langle 0a_2\rangle u_2\langle 0a_3\rangle ... \ u_{n-1}\langle a_n\rangle u_n \S$$

if and only if $a_1 a_2 a_3 ... a_n \in L(G)$

•

Coincidental Extension 6/6

```
In greater detail, \nu \S \Rightarrow ^+ z \S \Rightarrow \nu can be expressed as
            Y(0a_1)Y(0a_2)Y(0a_3)...Y(a_n)Y^{-1}\xi
\Rightarrow^i \# \langle 0a_1 \rangle X \langle 0a_2 \rangle Y \langle 0a_3 \rangle Y \langle a_4 \rangle \dots Y \langle a_n \rangle Y^{-1} \S
\Rightarrow \#\langle 4a_1\rangle X\langle 1a_2\rangle Y\langle 2a_3\rangle Y\langle a_4\rangle \dots Y\langle a_n\rangle Y^{-1}\xi
\Rightarrow^i \# \langle 4a_1 \rangle \# \langle 1a_2 \rangle X \langle 2a_3 \rangle Y \langle a_4 \rangle \dots Y \langle a_n \rangle Y^{-1} \S
\Rightarrow \# a_1 \# \langle 4a_2 \rangle X \langle 1a_3 \rangle Y \langle 2a_4 \rangle \dots Y \langle a_n \rangle Y^{-1} \S
\Rightarrow^i \#^i a_1 \#^i \langle 4a_2 \rangle \#^i \langle 1a_3 \rangle X \langle 2a_4 \rangle \dots Y \langle a_n \rangle Y^{-1} \S
\Rightarrow \# a_1 \# a_2 \# \langle 4a_3 \rangle X \langle 1a_4 \rangle Y \langle 2a_5 \rangle \dots Y \langle a_n \rangle Y^{-1} \S
            \#^{i}a_{1}\#^{i}a_{2}\#^{i}a_{3}...\langle 4a_{n-2}\rangle \#^{i}\langle 1a_{n-1}\rangle X\langle 2a_{n}\rangle Y^{-1}\S
\Rightarrow \#^i a_1 \#^i a_2 \#^i a_3 \dots a_{n-2} \#^i \langle 1 a_{n-1} \rangle X \langle 3 a_n \rangle Y^{-1} \S
\Rightarrow^{i_1} \#^i a_1 \#^i a_2 \#^i a_3 \dots \#^i a_{n-2} \#^i \langle 1 a_{n-1} \rangle \#^j X \#^k \langle 3 a_n \rangle \#^{i_1} \S
\Rightarrow \#^{i}a_{1}\#^{i}a_{2}\#^{i}a_{3}...\#^{i}a_{n-2}\#^{i}a_{n-1}\#^{i}a_{n}\#^{i}
```

• **Corollary**: Let $K \in RE$. Then, there exists a ε -free SCG, G, such that $K_\#$ ✓ L(G).

Use in Theoretical Computer Science

Use in Theoretical Computer Science

- **Corollary**: For every language $K \in RE$, there exists a homomorphism h and a language $H \in \varepsilon$ -free SC such that K = h(H).
- In a complex way, this result was proved on page 245 in [Greibach, S. A. and Hopcroft, J. E.: Scattered Context Grammars. J. Comput. Syst. Sci. 3, 232-247 (1969)]

4

Future Investigation

Future Investigation: k-limited coincidental extension

- Let k be a non-negative integer.
- For a symbol, #, and a string, $x = a_1 a_2 ... a_{n-1} a_n$, any string of the form $\# a_1 \# a_2 \# ... \# a_{n-1} \# a_n \# i$, where $k \ge i \ge 0$, is a k-limited coincidental #-extension of x.
- A language, K, is a coincidental a k-limited #-extension of L if every string of K represents a k-limited coincidental extension of a string in L and the deletion of all #s in K results in L, symbolically written as L k K

Example

• For $X = \{\#^i a \#^i b \#^i : 2 \ge i \ge 0\} \cup \{\#^i c \#^i d \#^i : 4 \ge i \ge 0\}$ and $Y = \{ab, cd\},$

$$Y_{4>\#} \blacktriangleleft X$$

Very Important Open Problem

Important Open Problem: ε -free SC = CS?

- Does there exist a non-negative integer k, such that for every L ∈ CS, L _{k>#} ✓ L(H) for some ε-free SCG, H?
- If so, I know how to prove ε -free $SC = CS \odot$.

END
